Fileshelf at a glance

Fileshelf manages downloads in Joomla 6 with Joomla's own means: categories, tags, access levels, fields and versions come from the core, not from a system of its own. Each download has exactly one file, one main category and, if you like, further categories in which it appears as well.

The list of downloads: title, categories, version, access level and how often each file was downloaded.

What Fileshelf does for you

- **Store files protected.** The files lie in a storage folder of their own, which Fileshelf locks against direct access and checks itself. Visitors only get a file through Fileshelf – with access check and counter.
- **Control access.** Joomla access levels, a password per download or per category, publishing period.
- **Show them on the website.** Menu items for categories, single downloads and the latest downloads, a module, shortcodes for articles and a button in the editor.
- **Let them be found.** The site search (Smart Search) finds downloads by title, description, file name and tag.
- **Maintain.** Tools reorder files, adopt files uploaded by FTP and check file details.

The parts

Fileshelf is installed as one package. It contains:

Part	Task
Component Fileshelf	Downloads, storage, website views, tools
System - Fileshelf	Category password, protection against deleting categories in use
Content - Fileshelf	Shortcodes in articles and modules
Button - Fileshelf	The button “Download” in the editor
Smart Search - Fileshelf	Downloads in the site search
FileSystem - Fileshelf	The area “Downloads” in the media manager
Module Fileshelf - Downloads	Latest, most popular, featured downloads or those of a category

The plugins are enabled on the first installation. Always keep “System - Fileshelf” enabled; you can disable the others if you do not use their feature.
