Shortcodes in articles

With shortcodes you place downloads in articles, modules and every other text that runs through the content plugins. The easiest way is the button **Download** in the editor (see *Editor button*); you can also write them by hand.

An article with every kind of shortcode and, below, the module.

The forms

Shortcode	Result
`{fileshelf id=12}`	Link with the title of the download
`{fileshelf id=12 text="Get the form"}`	Link with your own text
`{fileshelf id=12 button}`	Button
`{fileshelf id=12 button class="uk-button uk-button-primary"}`	Button with your own CSS classes
`{fileshelf id=12 count}`	Only the number of times the download was fetched

Shortcode	Result
`{fileshelf cat=3}`	List of the downloads of a category (main or additional)
`{fileshelf cat=3 layout=cards limit=5 order=popular}`	Cards, at most 5, most popular first

`{fsh …}` is the short form of `{fileshelf …}`. `order` knows `title` (default), `rtitle`, `newest`, `oldest`, `popular` and `ordering`; `limit` goes up to 100.

What visitors see

- If the visitor may fetch the download, the link or button appears.
- If it is protected, the title and a lock with the link **Enter password** or **Log in** appear.
- An unknown, unpublished or expired download does not appear at all. In Joomla's debug mode an HTML comment with the reason stands in its place.

> A list that stands alone in a paragraph replaces the paragraph. So write `{fileshelf cat=…}` on a line of its own.
