

The review view

The review view is your workplace. Here you go through the inventory, filter it and select what is to be cleaned up. You reach it through **All files** or directly through **Files without a reference**.

The review view as a grid: preview, dimensions, size and status at a glance.

Grid or table

The button **Table** or **Grid** switches the presentation:

- The **grid** shows thumbnails — good for recognising images.
- The **table** shows more entries per screen and sorts better — good for large collections.

The status indicators

Status	Meaning
Referenced	At least one occurrence found. The file is in use.

Status	Meaning
Without a reference	No occurrence found. A candidate — check the evidence before you act.
In quarantine	Already moved, restorable at any time.
No longer present	The file is not where it used to be — deleted or renamed without Joomla being involved (over FTP, for instance).

Why such files do not simply drop out of the list: their entry carries the optimisation backups and the quarantine history. So the entry stays and is only labelled — the reports on duplicates and optimisation leave it out, because there is nothing left to tidy up here. The *Status* filter shows you at any time which files are affected. If one comes back, the next scan picks it up again.

In addition, every tile shows **dimensions** and **file size**. Sorting by size descending is a good start: the largest unreferenced files bring the most space.

Filtering and searching

- **Search path** — full-text search over the file path.
- **Filter options** — narrow down by status, media type and folder. A folder filter includes subfolders.
- **Sorting** — by size, name or modification date, among others.
- **Reset** — restores the initial state if you have filtered yourself into a corner.

Selection across pages

The selection is kept server-side. So you can filter, page through, keep selecting — the files marked earlier stay selected. That matters when you are picking out specific files from several hundred.

With **all on this page** / **none** you mark the current page at once.

The coverage notice

If "**incomplete coverage**" appears at the top, at least one installed extension is not covered by a vetted profile yet. Media Organizer then cannot rule out that this extension uses media files.

The consequence: **deleting for good is blocked**. Quarantine and restoring stay possible — both are reversible after all. That is not a fault but the extension knowing its own limits.

Export

With **Export CSV** or **Export JSON** you take the inventory out — useful for agreeing things with clients or for a second opinion before anything happens. The export respects the filters currently set.

Where to go from here

- [Reading the evidence](#)
- [Quarantine, restoring, deleting for good](#)

Applies to version 1.2.0.
