Permissions and privacy

Notion Source is built so that your credentials stay protected and no data leaves your website unnecessarily.

The token stays on the server

- The Notion token lives solely in the plugin configuration (database table `#__extensions`) on your server.
- In the backend it is masked as a password field.
- It is **never** output to the frontend. All Notion requests run server-side; your visitors' browsers never see the token.

Only Notion is contacted

The only external connection goes to the Notion API (`api.notion.com`). No other services, no statistics or tracking servers are contacted. The data fetched is cached locally (see Entering the token and options).

The cache holds no secrets

The schema stored locally (under `administrator/cache/`) contains only database and field names, no token. It is stored as a PHP file with access protection, so calling it directly in a browser reveals nothing.

Image and file URLs from Notion

> Files and cover images from Notion are embedded via URLs hosted by Notion. For uploaded files these URLs are **time-limited** and may expire after a while. For images embedded

> permanently, better use an external URL in Notion or load the image into the Joomla media manager.

Who may change the settings

The plugin configuration — and with it the token — is accessible only to users with the corresponding backend permissions (usually administrators). Notion Source creates no frontend forms of its own and accepts no input from visitors.

Applies to version 1.2.4.
